

Extracellular vesicles from WJ-MSC/TERT273 Influence on myo-fibroblast differentiation

untreated control cells

TGF- β treated cells

Treatment of telomerized human dermal fibroblasts fHDF/TERT166 with transforming growth factor beta (TGF- β) induces expression of alpha smooth muscle actin (α -SMA).

Treatment of cells with TGF- β together with extracellular vesicles (EVs) from Wharton's Jelly derived mesenchymal stem cells (WJ-MSC/TERT273) reduces α -SMA expression significantly, demonstrating an effect of EVs on myofibroblast differentiation.
