

EV-BM-MS C/TERT292 characterization

Potency of EVs / anti-fibrotic activity *in vitro*

Treatment of dermal fibroblasts with TGF β 1 induces expression of α -SMA, detected by immunofluorescence.

Addition of EVs derived from BM-MS C/TERT292 cells significantly reduces α -SMA induction, indicating an anti-fibrotic activity of the EVs.

PP2, a Src-kinase inhibitor, is used as positive control.
